Report of Drought Condition in Peninsular Malaysia July-19, 2005

Summary

Based on rainfall records from 41 stations, most stations received substantial amount of rainfall during the third and second week of Jun. As a result, the drought conditions have improved for most part of Peninsular Malaysia. Start from April 15, 2005 By the end first week of Jun, only one out of ten rivers monitored on-line are still experiencing low flow condition, which is Sg. Kerian at Selama (6.9 cumecs with 5 to 10 years Average Recurrence Interval (ARI)). From the six dams monitored on-line, on July 18, 2005, Timah Tasoh dam had remaining dam storage of 19.91 MCM or 60.42% of its FSL capacity. This is a significant improvement from the dry condition experience earlier where its remaining storages were at 30.8% on 12th Mac 2005, and 28.33% (lowest in record) on 22nd Mac 2005. Beside that, on July 18, 2005 the water level in Macap and Sembrong dam still below than alert level, which are 0.53 m and 0.69 m, respectively.

1. Rainfall Analysis

For overall the drought condition of Peninsular Malaysia seems to be more improvement by the end of Jun 2005. Based on Table 1, most of the rainfall data are decrease from May to June 2005. Beside that, there is one station with a 0.0 mm in Perak station no. 5003028 (A15) and 17.5 mm at station no. 3411017 (B3) in Selangor. The rainfall data has been converted into the isohytal map, as shown in Figure 1 and 2. Based on the rainfall analysis or Table 1, 2 out of 7 rainfall stations in Johor still showing the decreasing of receiving rainfall and the rainfall deficiency ranging from 16% to 55%. The rainfall deficiency in Perlis, Kedah, Penang, Perak, Selangor, Negeri Sembilan and Pahang which are ranging from 25%, 18% to 38%, 8%, 19% to 41%, 26% to 44%, 11% and 6% to 35%, respectively. It shows that, the rainfall deficiency happen mostly in West Coast states to middle of Pahang. The East Coast states, in July 2005 the Terengganu and Kelantan started rainfall deficiency with a 17% and 9% to 23%, respectively.

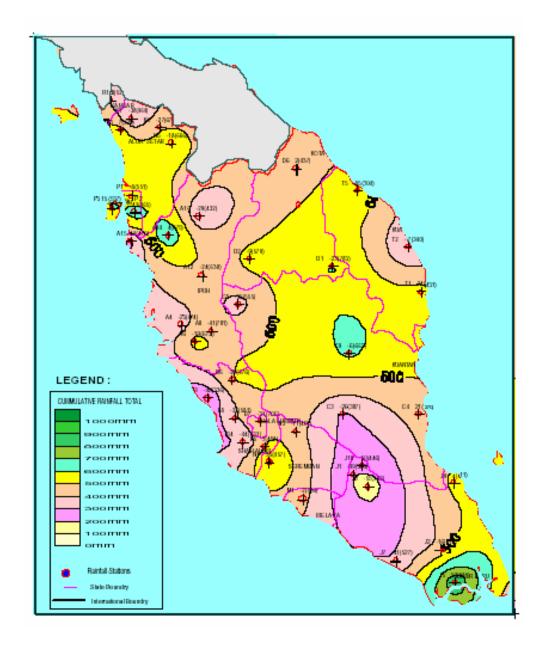

Figure 2 : Isohyet three monthly Rainfall Distribution (June 2005)

2. Low Flow Analysis

Based on Table 2, the analysis of the flow discharge (on July 18, 2005), Sg. Kerian at Selama (6.9 cumecs) in northern Perak is getting more rainfall because the flow discharge increasing from 6.3 cumecs (June 6, 2005) to 6.9 cumecs (July 18, 2005) but it still experiencing a severe low flow condition from 10 to 5 years ARI. Three other rivers, Sg. Muda at Jambatan Syed Omar, Sg. Bernam at

Jambatan SKC and Sg. Kelantan at Jambatan Guillerdmard are experiencing drought condition of 2 to 5 years ARI. Other areas of Peninsular Malaysia have normal or near normal flow conditions.

From Table 3 on July 18, 2005, the ranging of ARI of low flow recorded for Sg. Kelantan at Gulliermard Bridge (128 cumecs), Sg. Muda @ Syed Omar Bridge (11 Cumec) and Sg. Bernam at SKC Bridge (13 cumec) are 5 to 2 years, 5 to 2 years, 5 to 2 years, respectively.

3. Dam Storage Analysis

From the six dams monitored by Water Resources Unit, Hydrology and Water Resources Division are shown in Table 4. Based on Table 4, on June 6, 2005 and July 18, 2005 show that 2 out of 6 dams are below than alert level, which are Macap and Sembrong Dam. The dam level in Macap and Sembrong dam are 14.59 m and 6.50 m, respectively and the different of current level with alert level are 0.53 m and 0.69 m, respectively. The remaining storages in percentage for Macap and Sembrong Dam are 43.42% and 30.42%, respectively. Nevertheless, the Timah Tasoh dam level show the increasing of the dam level from June 6, 2005 to July 18, 2005 which are from 27.84 m to 28.0 m, respectively. Table 5 shows the dam monitoring in infokemarau.
